Why Lambda Calculus with Intersection Types?

Why Lambda Calculus with Intersection Types?

With the notion of filter lambda model, completeness of the type assignment was proved:

```
Theorem (Completeness)
```

 $\Gamma \vdash M : \sigma \Leftrightarrow \Gamma \models M : \sigma.$

Towards probabilistic reasoning about lambda terms with intersection types Syntax and Semantics of $P\Lambda^{\bigcap}$

▲□▶ ▲□▶ ▲ 臣▶ ★ 臣▶ 三臣 - のへぐ

Syntax of $P\Lambda^{\cap}$

Syntax of $P\Lambda^{\cap}$

Let $S = [0,1] \cap \mathbb{Q}$. The alphabet of the logic $\mathsf{P}\Lambda^{\cap}$ consists of

• all symbols needed to define lambda terms with intersection types,

- \bullet the classical propositional connectives \neg and $\wedge,$
- the list of probability operators $P_{\geq s}$, for every $s \in S$.

Syntax of $P\Lambda^{\cap}$

Let $S = [0, 1] \cap \mathbb{Q}$. The *alphabet* of the logic $P\Lambda^{\cap}$ consists of

- all symbols needed to define lambda terms with intersection types,
- \bullet the classical propositional connectives \neg and $\wedge,$
- the list of probability operators $P_{\geq s}$, for every $s \in S$.

Remark: Using $P_{>s}\alpha$ we can define other inequalities:

$$\begin{array}{ll} P_{s}\alpha & \text{stands for} & \neg P_{\leq s}\alpha, \\ P_{=s}\alpha & \text{stands for} & P_{\geq s}\alpha \wedge \neg P_{>s}\alpha. \end{array}$$

Towards probabilistic reasoning about lambda terms with intersection types Syntax and Semantics of $P\Lambda^{\bigcap}$

Kripke-style Semantics of $P\Lambda^{\cap}$

Kripke-style Semantics of $P\Lambda^{\cap}$

Definition ($P\Lambda^{\cap}$ -structure)

- A P Λ^{\cap} -structure is a tuple $\mathcal{M} = \langle W, \rho, \xi, H, \mu \rangle$, where:
- (i) W is a nonempty set of worlds, where each world is one lambda model,
 i.e. for every w ∈ W, w = ⟨L(w), ⋅w, [[]]w⟩;

(ii)
$$\rho: \mathbb{V}_{\Lambda} \times \{w\} \longrightarrow \mathcal{L}(w), w \in W;$$

(iii)
$$\xi: \mathbb{V}_{\text{Type}} \times \{w\} \longrightarrow \mathcal{P}(\mathcal{L}(w)), w \in W;$$

- (iv) H is an algebra of subsets of W, i.e. $H \subseteq \mathcal{P}(W)$ such that
 - $W \in H$,
 - if $U, V \in H$, then $W \setminus U \in H$ and $U \cup V \in H$;
- (v) μ is a finitely additive probability measure defined on H, i.e.
 - $\mu(W) = 1$, - if $U \cap V = \emptyset$, then $\mu(U \cup V) = \mu(U) + \mu(V)$, for all $U, V \in H$.

▲□▶ ▲□▶ ▲ 臣▶ ★ 臣▶ 三臣 - のへぐ

Satisfiability of a formula

Satisfiability of a formula

We say that a lambda statement $M : \sigma$ holds in a world w, denoted by $w \models M : \sigma$, iff

 $\llbracket M \rrbracket_{\rho}^{w} \in \llbracket \sigma \rrbracket_{\xi}^{w}.$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□

Satisfiability of a formula

We say that a lambda statement $M : \sigma$ holds in a world w, denoted by $w \models M : \sigma$, iff

 $\llbracket M \rrbracket_{\rho}^{w} \in \llbracket \sigma \rrbracket_{\xi}^{w}.$

Definition (Satisfiability relation)

The satisfiability relation $\models \subseteq P\Lambda_{Meas}^{\cap} \times For_{P\Lambda^{\cap}}$ is defined in the following way:

・ロト ・ 同 ト ・ 三 ト ・ 三 ・ うへつ

- $\mathcal{M} \models M : \sigma$ iff $w \models M : \sigma$, for all $w \in W$;

-
$$\mathcal{M} \models P_{\geq s} \alpha$$
 iff $\mu([\alpha]) \geq s$;

- $\mathcal{M} \models \neg A$ iff it is not the case that $\mathcal{M} \models A$;

-
$$\mathcal{M} \models A_1 \land A_2$$
 iff $\mathcal{M} \models A_1$ and $\mathcal{M} \models A_2$.

Towards probabilistic reasoning about lambda terms with intersection types Syntax and Semantics of $P\Lambda^{\bigcap}$

Example

Example

Consider a model with three worlds, i.e., let $\mathcal{M} = \langle W, \rho, \xi, H, \mu \rangle$, where:

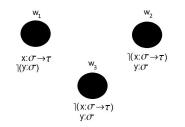

- $W = \{w_1, w_2, w_3\},\$
- $H = \mathcal{P}(W)$,
- $\mu(w_i) = \frac{1}{3}, i = 1, 2, 3,$

and ρ and ξ are defined such that $\mathcal{M} \models P_{=\frac{1}{3}}(x : \sigma \to \tau)$ and $\mathcal{M} \models P_{=\frac{2}{3}}(y : \sigma)$. Without loss of generality, suppose that $w_1 \models x : \sigma \to \tau$. We know that $y : \sigma$ holds in two worlds, so there are three different possibilities:
